

## SavingsUnited - Single Theme Project

Move all sites to a single them running on webpack

Part 1: Consolidate				
Milestone 1 flat_2017_webpacked	Milestone 2 flat_2016_webpacked	Milestone 3 remove rebatly_flat	Milestone 4 WLS to flat_2016_webpacked	Milestone 5 remove flat_2016
<p>Goal: Get rid of flat_2017_mobile and only use the webpacked version. Therefore we have to update the existing webpacked version with all the changes we implemented into 2017_mobile in the past. Currently it is way behind. After we merged the changes the theme we can switch the currently running sites (kupon.pl) to 2017_webpacked and remove the 2017_mobile from the code</p> <p>Update 2017_webpacked with all changes of 2017_mobile</p> <p>Switch all sites using 2017_mobile to 2017_webpacked or decide if we keep them all running on 2016</p> <p>Remove 2017_mobile from code</p>	<p>Goal: We want to migrate our main theme to webpack. Therefore create a child-theme flat_2016_webpacked which relies on 2016_flat files. All assets (js, CSS, images) and view files should fallback whenever possible. We create a child-theme because the migration from all sites to 2016_webpacked will take some time and we need to avoid heavy maintainance</p> <p>Create child-theme for 2016_webpacked but only create files that have to be different and fallback to 2016 whenever possible</p> <p>Rollout on SU branded sites</p>	<p>Goal: Remove rebatly theme and migrate all rebatly sites to flat_2016_webpacked</p> <p>Rollout 2016_webpacked on rebatly sites one by one</p> <p>Remove rebatly_flat from code</p>	<p>Goal: Move all remaining WLS sites to flat_2016_webpacked and get rid of style settings. Also move all custom styles from "custom head scripts" into the dedicated theme overwrites.css files</p> <p>Move WLS to flat_2016_webpacked one by one. Try to get rid of style settings and custom head scripts</p>	<p>Goal: remove flat_2016 and make flat_2016_webpacked the only full desktop theme left. Therefore we have to merge all files into 2016_webpacked and make it a full theme containing all assets and views.</p> <p>make 2016_webpacked no childtheme anymore</p> <p>remove flat_2016 from code</p>

Part 2: Innovate (to be defined)		
Milestone 1 design	Milestone 2 development	Milestone 3 rollout
<p>Goal: After having all sites running on webpack we can continue with the creation of the single template. The current situation is that we are planning to extend flat_2017_webpacked to all user agents and viewports. Currently we only serve mobile users with flat_2017_webpacked. We have to check the designs and see how we have to adopt them to be fully functional specially for WLS</p> <p>Evaluate needs specially for WLS. Also consider all findings we have from kupon.pl switch (are the features really an improvement)</p> <p>Review current design studies for that needs</p> <p>Draft definite design guide for development</p>	<p>Goal: Use the design drafts and evaluate if ist possible to build the new theme on top of flat_2017_webpacked. Develop all the features</p> <p>evaluate if we have to create a new theme or can extend flat_2017_webpacked</p> <p>Develop the theme</p>	<p>Goal: Rollout new theme too all sites and remove all other themes from code. At this stage we should be having a single webpack based theme that serves all of our sites</p> <p>Rollout to all sites</p> <p>remove flat_2016_webpacked</p>
